### Vv285 Recitation Class 1

Yuxiang Chen

May 13, 2022

### Outline

- About Me and My RC
- 2 Review of Vector Spaces
- 3 Linear Equations & Basis
- 4 Inner Product
- Seference

### Logistics and Style

- Mind-Map track through Horst's slides
  - More intuitive explanation.
  - ② No repetition. Ideal: my RC =  $(Horst' slides)^{\perp}$ .
  - Marked importance.
- Exercises with emphasis
  - 1 80% of them is close to exam's difficulty
  - 20% of them is a bit harder, through which I hope to strengthen your understanding for some important concepts
- Interactions and timely-feedback
  - 1 Hope to see your faces online :)
  - Welcome to any questions during or after my RC
  - On't be shy posting your solution on the chat board or just speaking up.

## Vector Space

Definition: A tripe  $(V, +, \cdot)$  is called a **real** vector space if

- 1. V is any set
- 2. +:  $V \times V \rightarrow V$  is a map (addition) with the following properties:
  - Communicativity:

$$u + v = v + u$$
 for all  $u, v \in V$ 

Associativity:

$$(u+v)+w=u+(v+w)$$
 for all  $u,v,w\in V$ 

- Additive Identity:
  - there exist an element  $0 \in V$  such that v + 0 = v for all  $v \in V$
- o Additive Inverse:
  - for every  $v \in V$ , there exists  $w \in V$  such that v + w = 0

4 / 23

# Vector Space

- 3.  $\cdot : \mathbb{R} \times V \to V$  is a map (scalar multiplication) with the following properties:
  - Multiplication Identity:
    - $1 \cdot u = u$  for all  $u \in V$
  - Associativity:

$$(ab)v = a(bv)$$
 for all  $u, v, w \in V$  and all  $a, b \in \mathbb{R}$ 

Distributive Property:

$$a(u+v)=au+av$$
 and  $(a+b)v=av+bv$  for all  $a,b\in\mathbb{R}$  and all  $u,v\in V$ 

### Subspace

Definition: Let  $(V,+,\cdot)$  be a real or complex vector space. If  $U\subseteq V$  and  $(U,+,\cdot)$  is also a vector space, then we say that  $(U,+,\cdot)$  is a subspace of  $(V,+,\cdot)$ 

### Subspace

Definition: Let  $(V,+,\cdot)$  be a real or complex vector space. If  $U\subseteq V$  and  $(U,+,\cdot)$  is also a vector space, then we say that  $(U,+,\cdot)$  is a subspace of  $(V,+,\cdot)$ 

There is no need to prove the above properties of addition and scalar multiplication of  $(U, +, \cdot)$ , actually, we only need to verify that

- > 0 ∈ *V*
- $\triangleright u_1 + u_2 \in U$  for all  $u_1, u_2 \in U$
- $\blacktriangleright$   $\lambda u \in U$  for all  $u \in U$  and  $\lambda \in \mathbb{R}$  (or  $\lambda \in \mathbb{C}$  for complex vector space)

In a word, we need to verify if this subset is closed under addition and multiplication, with confirmation of unit element. you can review the proof on Vv186 *Slide 339* 

## Exercise - Is this a vector space

Let  $\infty$  and  $-\infty$  denote two distinct objects, neither of which is in **R**. Define an addition and scalar multiplication on  $\mathbf{R} \cup \{\infty\} \cup \{-\infty\}$  as you could guess from the notation. Specifically, the sum and product of two real numbers is as usual, and for  $t \in \mathbf{R}$  define

$$t\infty = \begin{cases} -\infty & \text{if } t < 0, \\ 0 & \text{if } t = 0, \\ \infty & \text{if } t > 0, \end{cases} \qquad t(-\infty) = \begin{cases} \infty & \text{if } t < 0, \\ 0 & \text{if } t = 0, \\ -\infty & \text{if } t > 0, \end{cases}$$
$$t + \infty = \infty + t = \infty, \qquad t + (-\infty) = (-\infty) + t = -\infty,$$
$$\infty + \infty = \infty, \qquad (-\infty) + (-\infty) = -\infty, \qquad \infty + (-\infty) = 0.$$

Is  $\mathbf{R} \cup \{\infty\} \cup \{-\infty\}$  a vector space over  $\mathbf{R}$ ? Explain.

## Exercise - Is this a vector space

Let  $\infty$  and  $-\infty$  denote two distinct objects, neither of which is in **R**. Define an addition and scalar multiplication on  $\mathbf{R} \cup \{\infty\} \cup \{-\infty\}$  as you could guess from the notation. Specifically, the sum and product of two real numbers is as usual, and for  $t \in \mathbf{R}$  define

$$t\infty = \begin{cases} -\infty & \text{if } t < 0, \\ 0 & \text{if } t = 0, \\ \infty & \text{if } t > 0, \end{cases} \qquad t(-\infty) = \begin{cases} \infty & \text{if } t < 0, \\ 0 & \text{if } t = 0, \\ -\infty & \text{if } t > 0, \end{cases}$$
$$t + \infty = \infty + t = \infty, \qquad t + (-\infty) = (-\infty) + t = -\infty,$$
$$\infty + \infty = \infty, \qquad (-\infty) + (-\infty) = -\infty, \qquad \infty + (-\infty) = 0.$$

Is  $\mathbf{R} \cup \{\infty\} \cup \{-\infty\}$  a vector space over  $\mathbf{R}$ ? Explain.

**No!** Uniqueness of unit element, i.e. **0** 

## Real and Complex Vector Spaces

• The set of all functions  $f: \mathbb{R} \to \mathbb{R}$ : real vector space (with addition and scalar multiplication defined as pointwise way, i.e, conventional way)

## Real and Complex Vector Spaces

- The set of all functions  $f: \mathbb{R} \to \mathbb{R}$ : real vector space (with addition and scalar multiplication defined as pointwise way, i.e, conventional way)
- The set of n-tuples (n dimensional vectors)  $\mathbb{R}^n = \{x = (x_1, ..., x_n) : x_1, ..., x_n \in \mathbb{R}\}$  is a real vector space if the addition is defined by

$$x + y = (x_1, ..., x_n) + (y_1, ..., y_n)$$
  
:=  $(x_1 + y_1, ..., x_n + y_n), \quad x, y \in \mathbb{R}$ 

and scalar multiplication defined by

$$\lambda x = \lambda \cdot (x_1, ..., x_n) := (\lambda x_1, ..., \lambda x_n), \quad \lambda \in \mathbb{R}, \ x \in \mathbb{R}^n$$

## Real and Complex Vector Spaces

- The set of all functions  $f: \mathbb{R} \to \mathbb{R}$ : real vector space (with addition and scalar multiplication defined as pointwise way, i.e, conventional way)
- The set of n-tuples (n dimensional vectors)  $\mathbb{R}^n = \{x = (x_1, ..., x_n) : x_1, ..., x_n \in \mathbb{R}\}$  is a real vector space if the addition is defined by

$$x + y = (x_1, ..., x_n) + (y_1, ..., y_n)$$
  
:=  $(x_1 + y_1, ..., x_n + y_n), \quad x, y \in \mathbb{R}$ 

and scalar multiplication defined by

$$\lambda x = \lambda \cdot (x_1, ..., x_n) := (\lambda x_1, ..., \lambda x_n), \quad \lambda \in \mathbb{R}, \ x \in \mathbb{R}^n$$

• The above vector space is complex if the multiplication factor  $\lambda$  is defined over  $\mathbb{C}$ .

#### **Exercises**

 $V,\,U$  are real (complex) vector spaces, then which of the followings are true

- A  $V \cap U$  is a vector space
- B  $V \cup U$  is a vector space
- C  $V + U := \{u + v : \forall u \in U, \forall v \in V\}$  is a vector space
- D Suppose U is a subspace of V, then  $V \setminus U$  is a vector space
- E Suppose U is a subspace of V, then  $(V \setminus U) \bigcup \{0\}$  is a vector space
- F Suppose U is a subspace of V and  $v \in V$ , then  $v + U := \{v + u : u \in U\}$  is always a vector space

#### **Exercises**

V, U are real (complex) vector spaces, then which of the followings are true

- A  $V \cap U$  is a vector space
- B  $V \cup U$  is a vector space
- C  $V + U := \{u + v : \forall u \in U, \forall v \in V\}$  is a vector space
- D Suppose U is a subspace of V, then  $V \setminus U$  is a vector space
- E Suppose U is a subspace of V, then  $(V \setminus U) \bigcup \{0\}$  is a vector space
- F Suppose U is a subspace of V and  $v \in V$ , then  $v + U := \{v + u : u \in U\}$  is always a vector space

Answer: A and C

### Normed Vector Space

What is "norm"?

## Normed Vector Space

#### What is "norm"?

Norm is a map (function) defined over a vector space V,  $\|\cdot\|: V \to \mathbb{R}$ , such that for all  $u, v \in V$  and all  $\lambda \in \mathbb{R}$  ( $\mathbb{C}$  if V is a complex vector space):

- 1.  $||v|| \le 0$  and ||v|| = 0 if and only if v = 0
- $2. \|\lambda \cdot \mathbf{v}\| = |\mathbf{v}| \cdot \|\mathbf{v}\|$
- 3.  $||u+v|| \le ||u|| + ||v||$

## Normed Vector Space

#### What is "norm"?

Norm is a map (function) defined over a vector space V,  $\|\cdot\|: V \to \mathbb{R}$ , such that for all  $u, v \in V$  and all  $\lambda \in \mathbb{R}$  ( $\mathbb{C}$  if V is a complex vector space):

- 1.  $||v|| \le 0$  and ||v|| = 0 if and only if v = 0
- $2. \|\lambda \cdot \mathbf{v}\| = |\mathbf{v}| \cdot \|\mathbf{v}\|$
- 3.  $||u+v|| \le ||u|| + ||v||$

If we can define a norm over a vector space V, then we say V is a **normed vector space**.

## Normed Vector Spaces - Examples

⇒ p-Norm:  $\|x\|_p = (\sum_{j=1}^n |x_j|^p)^{1/p}$  for any  $p \in \mathbb{N} \setminus \{0\}$  in  $\mathbb{R}^n$  when p = 2 we obtain the usual Euclidean norm when  $p = \infty$  obtain the max norm  $\|x\|_\infty = \max_{1 \le k \le n} |x_k|$ 

## Normed Vector Spaces - Examples

- P-Norm:  $\|x\|_p = (\sum_{j=1}^n |x_j|^p)^{1/p}$  for any  $p \in \mathbb{N} \setminus \{0\}$  in  $\mathbb{R}^n$  when p=2 we obtain the usual Euclidean norm when  $p=\infty$  obtain the max norm  $\|x\|_\infty = \max_{1 \le k \le n} |x_k|$
- $ightharpoonup C([a,b]), \ [a,b] \subseteq \mathbb{R}, \ \text{with} \ \|f\|_{\infty} = \sup_{x \in [a,b]} |f(x)|.$
- Later we'll talk about inner product space and induced norm.

### Review for this week - Linear equations & Basis

- 1. Systems of linear equations know the proof of fundamental lemma for homogeneous equations
- 2. Finite dimensional vector space
  - Linear combination and span
  - > Important: definition of basis (unique presentation), property (1. span the whole space 2. linear independence)
  - Dimension of vector space
  - Basis extension theorem
  - > Sums of vector spaces. **Important**: direct sum

### Something Horst asks us to do

3.28. Theorem. Let V be a vector space and  $U, W \subset V$  be finite-dimensional subspaces of V. Then

$$\dim(U+W)+\dim(U\cap W)=\dim U+\dim W.$$

The proof will discussed in recitation class.

#### Inner Product Space - Basic properties

- Positivity
- Definiteness
- Additivity in the **second** slot (note the difference with other references!)
- Homogeneity in the second slot
- Conjugate symmetry

#### **Inner Product Space** - Basic properties

- Positivity
- Definiteness
- Additivity in the **second** slot (note the difference with other references!)
- Homogeneity in the second slot
- Conjugate symmetry

How to prove the additivity in the first slot ?

#### Inner Product Space - Basic properties

- Positivity
- Definiteness
- Additivity in the **second** slot (note the difference with other references!)
- Homogeneity in the second slot
- Conjugate symmetry

How to prove the additivity in the first slot ?

Is inner product linear in the first slot?

ightharpoonup Cauchy-Schwarz Inequality:  $|\langle u, v \rangle| \leq ||u|| \cdot ||v||$ 

- ➤ Cauchy-Schwarz Inequality:  $|\langle u, v \rangle| \le ||u|| \cdot ||v||$ More intuitive proof – using orthogonal projection
- ➤ Induced norm. Question: Is every norm an induced norm?
- Angel between vectors.
- Important: Orthogonality, orthogonal complement, Pythagoras' Theorem (the generality of linear algebra)
- Orthonormal bases (orthogonal + normal (unit norm)), Parseval's Theorem
- ightharpoonup Projection theorem: decompose a vector in to U and  $U^{\perp}$ , which is unique
- Bessel's inequality

Simpler proof for best approximation (slides 104)

Suppose  $P_v$  is the projection from  $v \in V$  to U, i.e,  $P_v = \sum_{i=1}^r \lambda_i e_i$ , and  $u \in U$  is any vector.

We want to show  $||v - P_v|| \le ||v - u||$ 

Simpler proof for best approximation (slides 104)

Suppose 
$$P_v$$
 is the projection from  $v \in V$  to  $U$ , i.e,  $P_v = \sum_{i=1}^r \lambda_i e_i$ , and  $u \in U$  is any vector.

We want to show  $||v - P_v|| \le ||v - u||$ 

**Proof:** 

$$||v - u||^{2} = \left|\left|\underbrace{v - P_{v}}_{\in U^{\perp}} + \underbrace{P_{v} - u}_{\in U}\right|\right|^{2} = ||v - P_{v}||^{2} + ||P_{v} - u||^{2}$$

$$> ||v - P_{v}||^{2}$$

➤ Important: **Gram-Schmidt Orthonormalization** (remember to reduce the norm to unit!)

### **Exercises - Orthogonal Complement**

Suppose U is a subspace for a finite dimension vector space V, prove that  $U=(U^\perp)^\perp$ 

# Exercise\* - deterministic property of inner product

Let V be a real vector space and  $\tau: V \times V \to \mathbb{R}$ . Show that if

- (a)  $\tau(v, v) > 0$  for some  $v \in V$ ;
- (b)  $\tau(v, v) \neq 0$  for any  $v \neq 0$ ;
- (c)  $\tau(v, \lambda u) = \lambda \tau(v, u)$  for  $v, u \in V$  and  $\lambda \in \mathbb{R}$ ;
- (d)  $\tau(v, u) = \tau(u, v)$ ;
- (e)  $\tau(v, u + w) = \tau(v, u) + \tau(v, w)$

then  $\tau$  is an inner product on V.

# Exercise\* - deterministic property of inner product

Proof:1

Suppose that there is some  $u \in V$  with  $\tau(u,u) < 0$ . Let  $g: [0,1] \to \mathbb{R}$  be defined by

$$g(t) = \tau(tv + (1-t)u, tv + (1-t)u).$$

g is continuous because of (c) and (d). By the Mean Value Theorem for continuous functions,  $g(t_0)=0$  for some  $t_0\in(0,1)$ . Since  $v\neq t^{-1}(t-1)u$  (why?), this shows that  $\tau(h,h)=0$  for some  $h\neq 0$ , contradicting (b). Therefore,  $\tau(h,h)>0$  for all  $h\in V\setminus\{0\}$ . Then (c) implies that  $\tau(0,0)=0$ . It follows that  $\tau$  is an inner product on V.

<sup>&</sup>lt;sup>1</sup>This proof is from Leyang Zhang

# Exercise - Cauchy-Schwarz Inequality

#### Prove that

- 1.  $16 \le (a+b+c+d)(\frac{1}{a}+\frac{1}{b}+\frac{1}{c}+\frac{1}{d})$
- 2.  $(x_1 + \cdots + x_n)^2 \le n(x_1^2 + \cdots + x_n^2)$  for all positive integers n and all real numbers  $x_1, \dots, x_n$

# Exercise - Cauchy-Schwarz Inequality

#### Prove that

1. 
$$16 \le (a+b+c+d)(\frac{1}{a}+\frac{1}{b}+\frac{1}{c}+\frac{1}{d})$$

2.  $(x_1 + \cdots + x_n)^2 \le n(x_1^2 + \cdots + x_n^2)$  for all positive integers n and all real numbers  $x_1, \dots, x_n$ 

Hint

**1** for 2, try u = (1, ..., 1) and  $v = (x_1, ..., x_n)$ 

### Exercise - Gram-Schmidt Orthonormalization

On  $\mathcal{P}_2(\mathbf{R})$ , consider the inner product given by

$$\langle p, q \rangle = \int_0^1 p(x)q(x) dx.$$

Apply the Gram–Schmidt Procedure to the basis  $1, x, x^2$  to produce an orthonormal basis of  $\mathcal{P}_2(\mathbf{R})$ .

### Exercise - Gram-Schmidt Orthonormalization

#### Solution:

Memorize the algorithm, given  $\{v_1, v_2, v_3\}$  an independent set:

$$\begin{split} e_1 &= \frac{v_1}{\|v_1\|} = 1 \\ e_2 &= \frac{v_2 - \langle v_2, e_1 \rangle e_1}{\|v_2 - \langle v_2, e_1 \rangle e_1\|} = 2\sqrt{3}(x - \frac{1}{2}) \\ e_3 &= \frac{v_3 - \langle v_3, e_2 \rangle e_2 - \langle v_3, e_1 \rangle e_1}{\|v_3 - \langle v_3, e_2 \rangle e_2 - \langle v_3, e_1 \rangle e_1\|} = 6\sqrt{5}(x^2 - x + \frac{1}{6}) \end{split}$$
